

GitHub is a web-based platform designed to help developers collaborate on projects and manage their code. It provides a centralized location for storing and sharing code, making it easier for multiple people to work together on the same project.

Here are the key reasons why developers use GitHub:

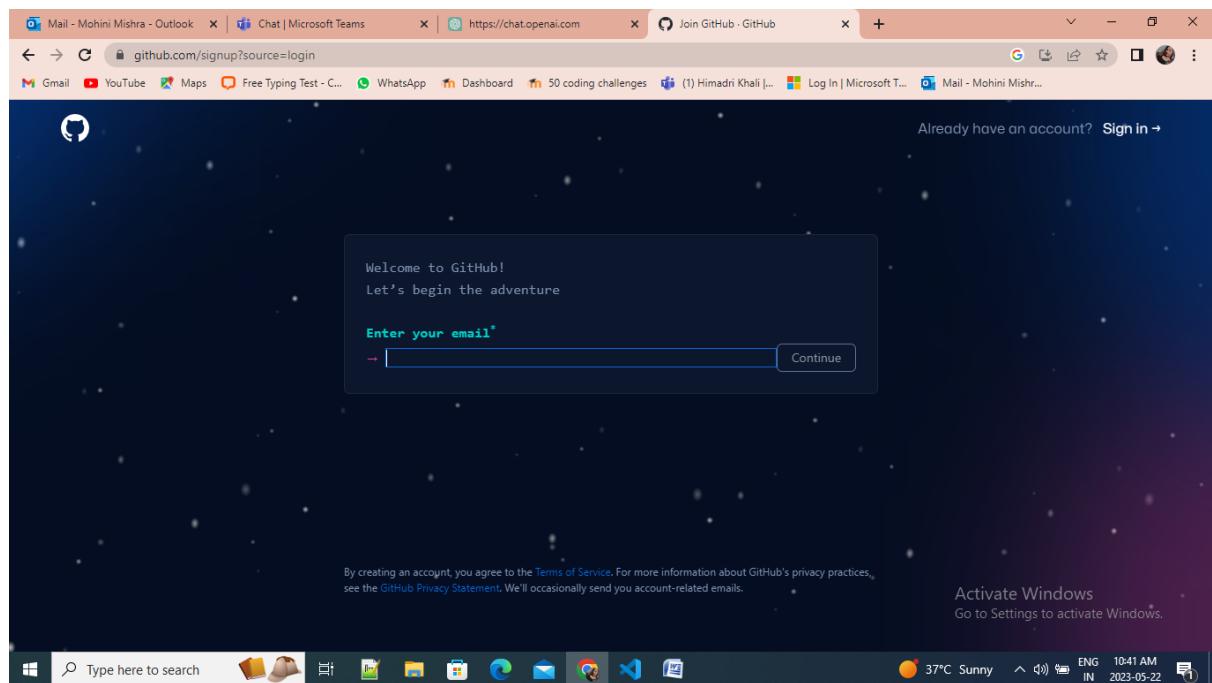

1. **Version Control:** GitHub uses a technology called Git, which allows you to track changes in your code over time. It keeps a record of every modification, allowing you to easily revert back to previous versions if needed.
2. **Collaboration:** GitHub enables multiple developers to work on the same project simultaneously. It provides features like pull requests, where you can propose changes to the codebase, have discussions, and review each other's code before merging it into the main project.
3. **Code Sharing:** GitHub serves as a platform to share your code with others. You can make your projects public, allowing anyone to view and contribute to them, or keep them private for personal or team use.
4. **Issue Tracking:** GitHub has a built-in issue tracking system that helps you manage and organize tasks, bugs, or feature requests. This way, you can keep track of what needs to be done, assign tasks, and communicate with your team effectively.

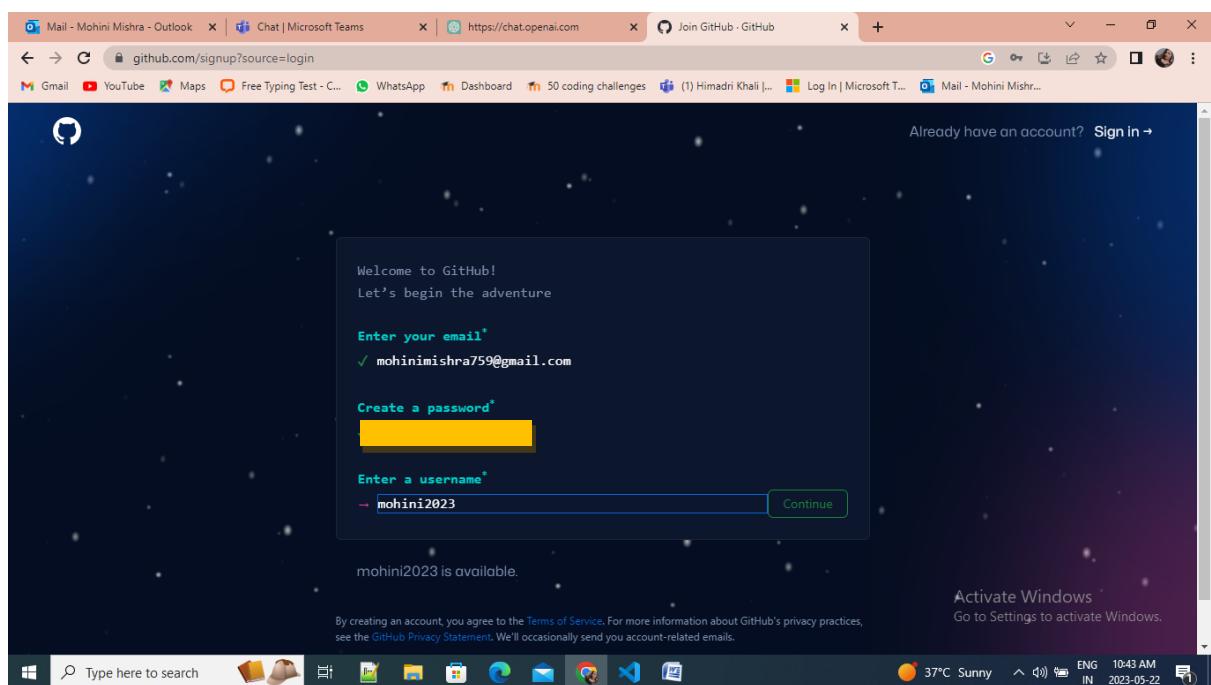

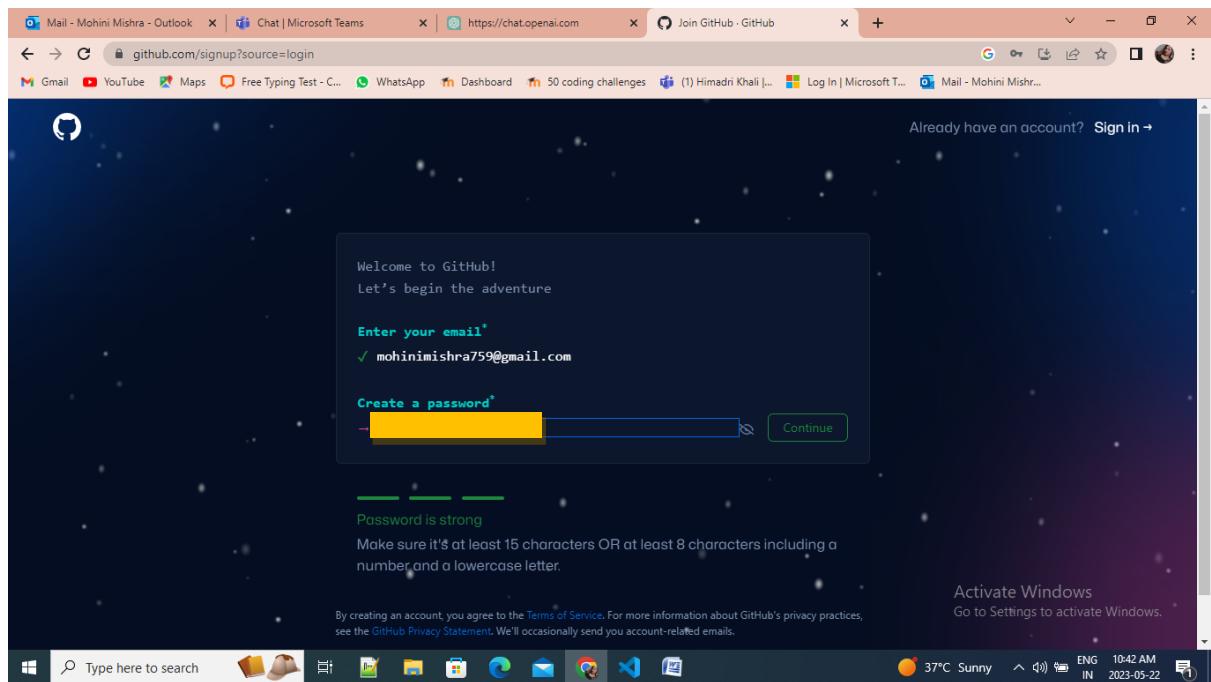

Now, let's walk through the basic steps to get started with GitHub:

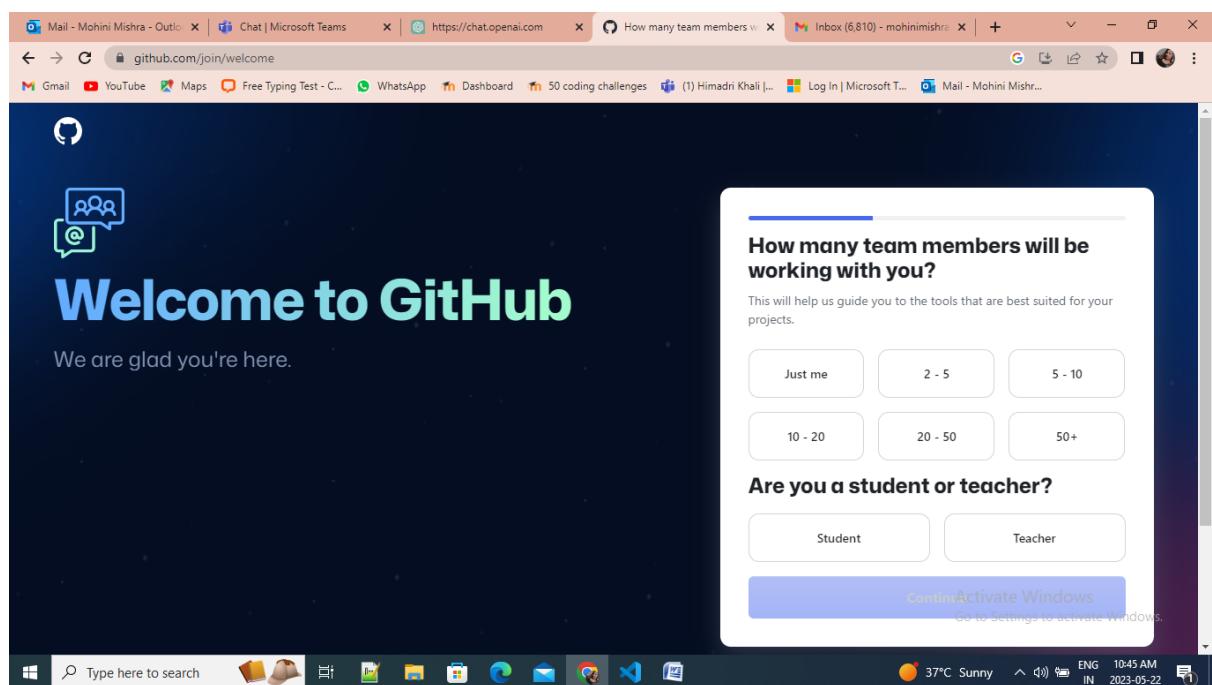

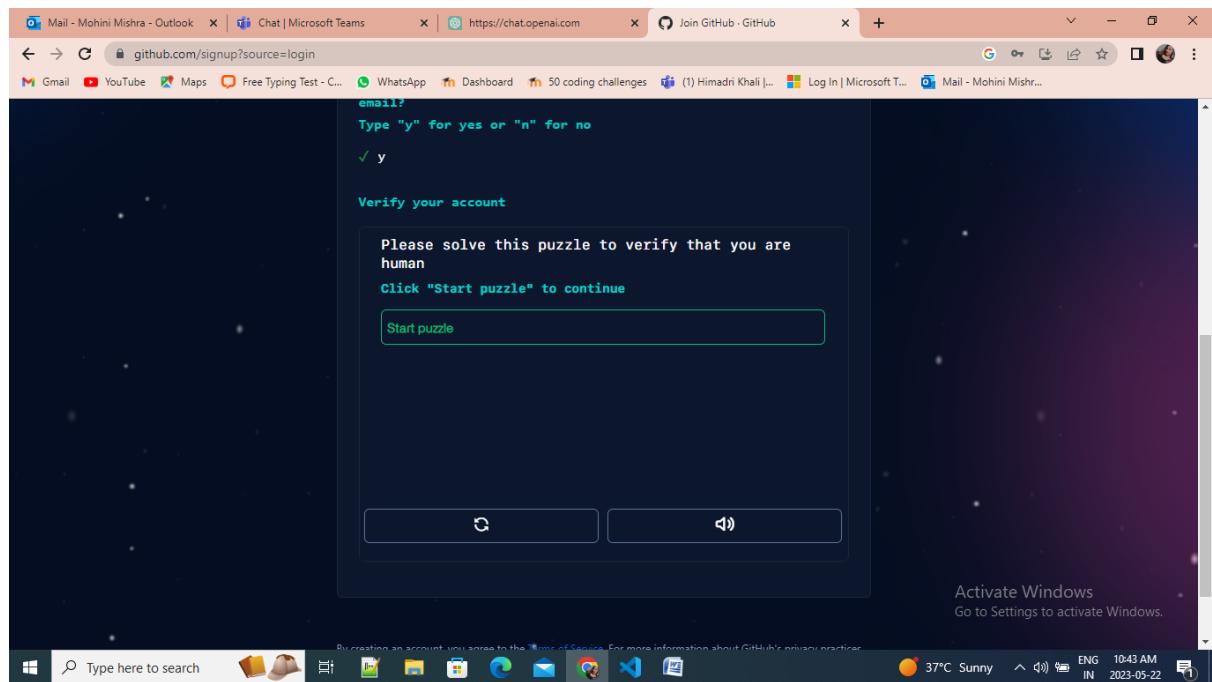

1. **Sign up:** Go to the GitHub website (github.com) and create an account. You can choose between a free account and paid plans with additional features.
2. **Create a Repository:** A repository (or repo) is like a project folder where you store **Create a Repository:** your code. Click on the "New" button on the GitHub homepage, give your repo a name, and choose the settings (public or private) as per your preference.
3. **Clone the Repository:** To work on your project locally, you need to make a copy of the repository on your computer. This is called "cloning." Install Git on your computer, open a terminal (command prompt), navigate to the desired directory, and run the command: `git clone <repository URL>`.

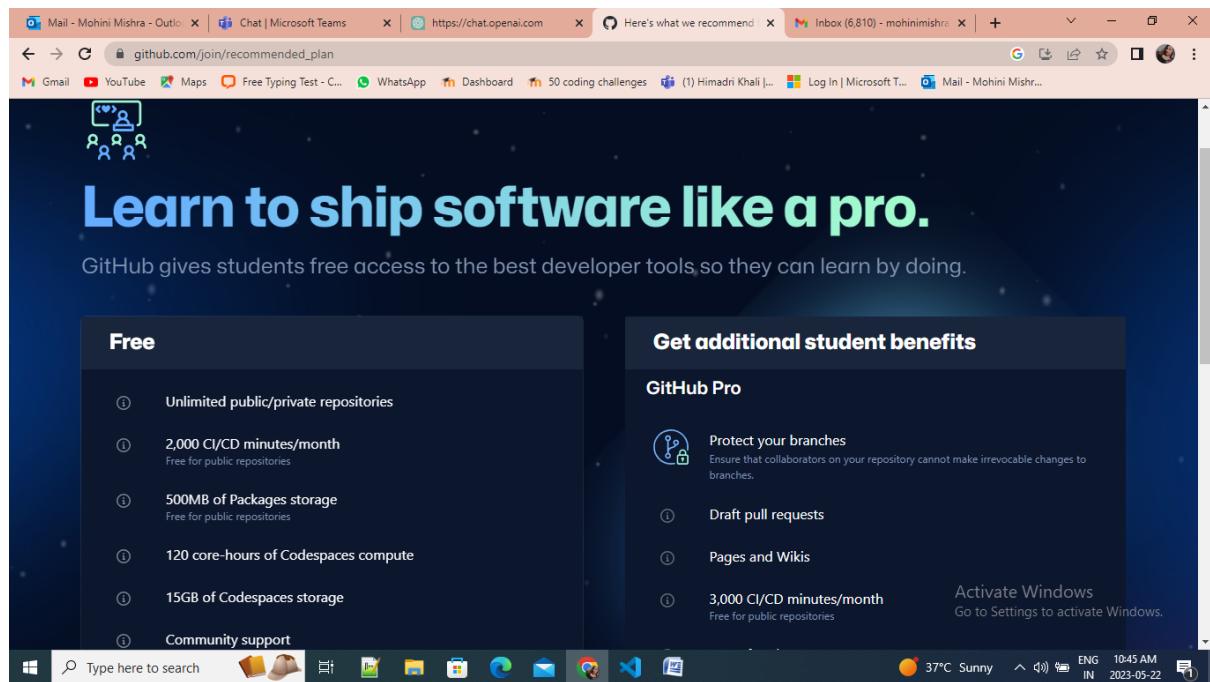

4. **Make Changes:** Start making changes to your code using your preferred code editor. Once you're done, save your changes.
5. **Commit Changes:** Committing is like taking a snapshot of your code at a specific point in time. In the terminal, navigate to your repository's directory and run the command: `git add .` to stage your changes, then `git commit -m "your commit message"` to commit them.
6. **Push Changes:** Pushing your changes means uploading them to GitHub. Use the command: `git push origin <branch-name>` to push your committed changes to the remote repository.
7. **Pull Requests and Collaboration:** If you're working with others, you can create a pull request on GitHub to propose your changes to the main project. Others can review your code, provide feedback, and suggest modifications before merging your changes.

These are the basic steps to get started with GitHub, but there are many other advanced features and concepts you can explore as you become more comfortable with the platform. GitHub provides extensive documentation and guides to help you along the way. Happy coding!

Learn to ship software like a pro.

GitHub gives students free access to the best developer tools so they can learn by doing.

Free

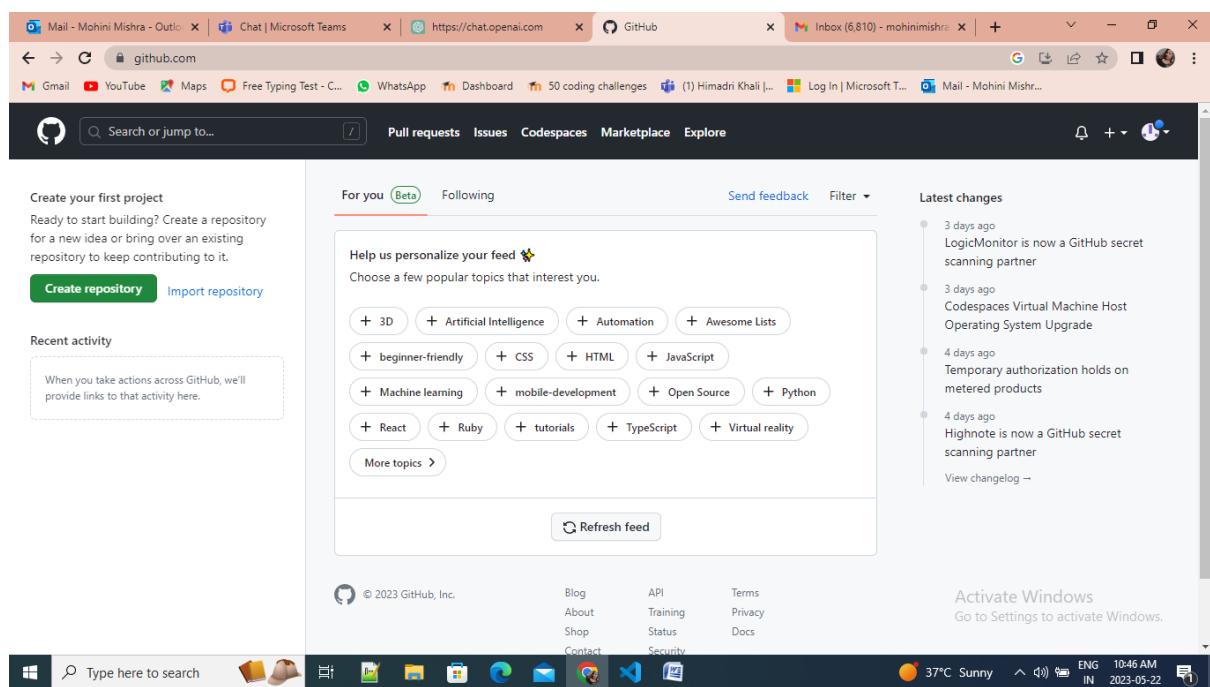

- Unlimited public/private repositories
- 2,000 CI/CD minutes/month

Activate Windows
Go to Settings to activate Windows.

1. **git init**: Initializes a new Git repository in the current directory.
2. **git clone [repository]**: Clones or copies a remote repository to your local machine.
3. **git add [file]**: Adds a file to the staging area in preparation for committing.
4. **git commit -m "[message]"**: Commits the changes in the staging area with a descriptive message.
5. **git status**: Displays the current status of your working directory and staging area.
6. **git push**: Pushes your local commits to a remote repository.
7. **git pull**: Fetches changes from a remote repository and merges them into your current branch.
8. **git branch**: Lists all branches in the repository.
9. **git branch [branch_name]**: Creates a new branch with the given name.
10. **git checkout [branch_name]**: Switches to the specified branch.
11. **git merge [branch_name]**: Merges the specified branch into the current branch.
12. **git log**: Shows a log of all commits in the current branch.
13. **git remote**: Lists all remote repositories.
14. **git remote add [remote_name] [remote_url]**: Adds a remote repository with the given name and URL.
15. **git stash**: Stashes changes in the working directory, allowing you to switch branches without committing.
16. **git reset [file]**: Unstages the specified file, removing it from the staging area.
17. **git diff**: Shows the differences between the working directory and the staging area.

These are just a few commonly used Git commands. Git is a powerful version control system with many more commands and options. You can use `git --help` or `git [command] --help` for more information on any specific command.
